What can we do for the spectrum?

Mario Maniewicz

Director, ITU Radiocommunications Bureau

Nov/2021

Spectrum in National, Regional, and International levels

National and Regional policies feed
the International Framework

International Regulations feed the
Regional and National Frameworks

Connectivity

Digital Transformation

Sustainability

Digital Inclusion

Spectrum Policies

What are the national
priorities?

What problems are we trying
to solve?

Terrestrial Services

- Mobile Services (IMT, RLANs, including Wi-Fi)
- Fixed Services
- HAPS/HIBS

Satellite Services

- Satellite Services (GSO, non-GSO)
- MSS IoT
- Space Services

Spectrum Regulation

What services could be used to address different spectrum policies?

How to balance the needs of different services?

Eliminate harmful interference

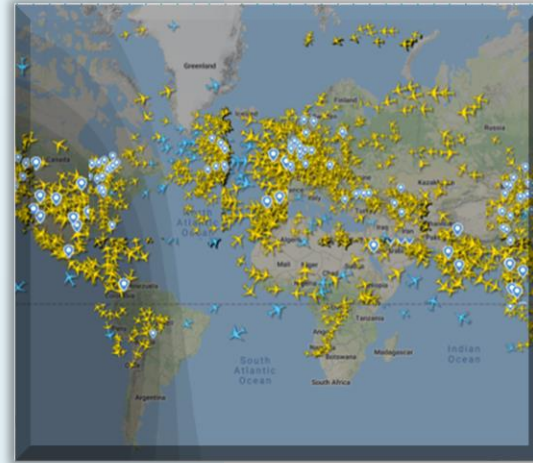

Ensure rational, equitable, efficient and economic use of spectrum by all services

International Regulations

How to address the needs of different countries while avoiding harmful interference?

International Standards

All radiocommunication services

- Emergency communications (public protection and disaster relief, search and rescue)
- Aeronautical (unmanned aircraft systems, sub-orbital vehicles)
- Maritime (safety of life at the sea, global maritime distress and safety system)
- Broadcasting (standards for television)
- Satellite systems (global radionavigation satellite systems, ESIMs, VSATs)
- Etc

Education

Health

Agriculture

Energy and Utilities

Spectrum Licensing

What licensing models to use?

How to address the needs of other sectors/verticals?

Integrated Approach

- 01. Coverage**

Rural and remote areas have access to secure and high-quality broadband networks
- 02. Affordability**

Services and devices are affordable to the end-user
- 03. Digital skills**

People have the skills they need to use these services
- 04. Relevant content**

Content is localized and meaningful

Environmental Impact & Resilience

New considerations in
the post-COVID-19
era

- Environmental impact of radiocommunication devices (e.g. energy efficiency)
- Resilience of networks in facing increasing number of natural disasters and global pandemics
